

RB 4700

Commercial & Industrial Regulator

The RB 4700 regulator is designed for use in industrial and distribution applications such as district station and heating plants, and for industrial customers.

DESCRIPTION

The RB 4700 is a pilot-operated regulator with an optional integrated safety shut-off device.

Its pilot system provides a fast and accurate response to flow rate variation.

Pilot supply is protected by a separate fine filter. An automatically loaded pressure feeder allows accurate control at high inlet pressure.

The optional built-in shut-off valve offers protection against over-pressure or over- and under-pressure. Its bypass system makes it easy to relatch the shut-off valve.

KEY BENEFITS

- » 100 mbar: AC 1 / SG 2.5

The typical lock-up pressure zone is:

$$\frac{Q_{min, Pu}}{Q_{max, Pu}} = \frac{2.5}{100}$$

PILOT SYSTEM

RB 4700 regulators are equipped with a TF 500 series pilot system, as follows:

TF 5	1	X	Options
		1	Low pressure: 5 - 280 mbar
		2	Medium pressure: 0.1 - 1 bar
		3	High pressure: 0.25 - 13 bar

Spring characteristics:

De: external diameter Lt: no. of spires

Standard conditions:

- Absolute pressure of 1.013 bar
- Temperature of 15°C

Correction factor for non-natural gas applications:

The flow rates are indicated for a 0.6 specific gravity gas. To determine the volumetric flow rate for gases other than natural gas, multiply or calculate the values in the capacity tables using the sizing equations with a correction factor. The table below lists correction factors for some common gases:

Gas type	Specific gravity	Correction factor
Air	1.00	0.77
Butane	2.01	0.55
Carbon dioxide (dry)	1.52	0.63
Carbon monoxide (dry)	0.97	0.79
Natural gas	0.60	1.00
Nitrogen	0.97	0.79
Propane	1.53	0.63
Propane-Air mix	1.20	0.71

Specific gravity or relative density (air = 1, non-dimensional value)

Use the following formula to calculate the correction factor for gases not listed above. In the formula, d is the specific gravity of the gas.

$$\text{Correction factor} = \sqrt{\frac{0.6}{d}}$$

where:

Q = volumetric flow rate in m³/h at standard conditions
P_U = absolute inlet pressure in bar
P_D = absolute outlet pressure in bar
Sin = angle in degrees

TF 513	20565134	6	35	60	6.5		4 - 13

The TF 500 series pilot system includes a built-in pre-regulator which is loaded by the outlet pressure to provide the pilot with a feeding pressure 500 mbar above outlet pressure.

The pre-regulator is fitted with a separate filter.

Remote Control

The TF 512-PL series pilot system is designed for applications where the regulator set point must be controlled remotely, such as leak management systems, process control applications, etc. In the TF 512-PL series pilot system, the pilot setting element, which is a spring in conventional pilots, is replaced by an external loading pressure. See separate Technical Information Bulletin

Accessories

A separate AP series accelerator may be added to the TF 500 series pilot system. This accelerator is recommended in case of on/off loads in order to limit the pressure surge when the gas demand stops.

The AP series accelerators can be set in the following ranges:

- » AP/1 Low pressure: 5 - 280 mbar
- » AP/2 Medium pressure: 0.1 - 1 bar
- » AP/3 High pressure: 0.25 - 13 bar

FLOW CAPACITY

Sizing Equation

For a 0.6 specific gravity gas, the wide-open orifice flow (Q) may be calculated using the following equations:

$$\text{» Sub-critical flow behaviour: } Q = K_G \sqrt{P_D(P_U - P_D)} \quad \text{where } (P_U - P_D) \leq 0.5 P_U$$

$$\text{or } Q = K_G \frac{P_U}{2} \sin \left[K_1 \sqrt{\frac{(P_U - P_D)}{P_U}} \right] \quad \text{where } (P_U - P_D) \leq 0.5 P_U$$

$$\text{» Critical flow behaviour: } Q = K_G P_U / 2 \quad \text{where } (P_U - P_D) > 0.5 P_U$$
